#### Strong local presence around the globe

## Our applications - in touch with GEA every day

# Hard Seltzer

### Alcoholic Seltzer - Market Trends

#### Seltzer beer market drivers

- Health conscious consumers low calorie content
- Regular "Water" market boom
- Unlimited flavor options todays consumer loves choices
- Fashionable trade up from light beer
- Tax relief from ethanol based products, ie canned cocktails
- High profit potential for brewer
- Seltzer beer market trend
  - Outperforming total beer
  - Estimated that the US consumer market was shorted by tens of millions of CE's in 2019
  - Alcoholic seltzer held 2.6% volume share of the US alcohol beverage market in 2019 up from 0.85% in 2018
    - Source: IWSR

#### HARD SELTZERS TO REACH \$1.5 BILLION THIS YEAR

Hard Seltzers generated \$1 billion with only 200 items on shelf!

surce: Nielsen Off Premise All Outlet Scan; 52 weeks ending 11/02/19

#### HOW DOES THAT COMPARE?

Source: Nielsen Off Premise Scan All Outlet; 52 weeks ending 11/02/19

### Why Craft Brewers?

Craft brewers have made a living distinguishing their products from the brewing giants... is this possible with hard seltzer? We are talking water here.

The short answer is yes!

Creativity

- Flavors such as exotic fruits and botanicals have only been slightly explored. Add blends and the possibilities are endless
- Marketing The opportunity for clever names, logos, and collaborations is infinite
- Draught options, expand your tap room variety
- Wide ABV range is possible
- Ease of entry into the market
  - Relatively straightforward transition for a traditional craft brewer to produce craft seltzer.
  - Cost is manageable while return is high
  - Same distribution channels as traditional beer

## It's not that hard!

### Brewing Hard Seltzer - the GEA way

#### **Complete Process Coverage:**

- Wort/Base Production
- Wort Aeration
- Yeast Handling
- Fermentation Optimization
- Centrifugation
- Membrane Filtration
- Flavor Blending Solutions
- Carbonation
- Flash Pasteurization
- Filling and packaging

# Liquid Jet Mixing

## **GEA Fermentation Optimization with Jet Mixing**

#### engineering for a better world

#### Benefits of GEA jet mixing technology

- Increase ABV potential
- Better attenuations
- Improve consistency and control of fermentation
- Reduce time of fermentation, maturation, and cooling
- Homogenization of the batch for easier downstream processing
- Potential for additions
- Real time monitoring possible

### Movements due to formation of CO<sub>2</sub>

- Denk and Stern visualized and measured the flow in a cylindroconical fermenter caused by rising CO<sub>2</sub> bubbles already in 1979.
- The model of the bubble column was confirmed by Schuch in 1996.
- How do we optimize this natural phenomenon?

#### The enhancement: Jet Mixing

- Jet mixing in the tank using a GEA jet mixer driven by a liquid flow
- Jet mixer flow is supplied by a centrifugal pump fed from the tank bottom
- The flow is oriented in the center of the vessel and directed upward; similar to that caused by the formation of CO<sub>2</sub> and natural convection currents
- Inside the tank, the bulk of the mixed liquid is drawn into the jet mixer through its side openings, thus driving flow upward inside the tank
- Due to the special design, only ¼ of the total mixing flow created in the tank has to be supplied via the pump

### Energy input (example of fermentation application)

- Tank with 2,660 hl net content
- Liquid jet  $\dot{V}_{f}$  80 hl/h
- Liquid mixture  $\dot{V}$ = 325 hl/h
- Mixing time T = 2,660 hl / 325 hl/h = 8.2 h
- Power consumption of pump: 1.7 kW
- Power consumption: 40.8 kWh per day

At 13.2 cents per kWh, total cost would be \$5.39 per day!

#### Process design

- Jet mixer with lance, vertically installed in tank bottom cone
- Control unit including
  - Speed-controlled circulation pump fed from the tank bottom
  - Protection against dry running
  - Flow measurement
  - Pressure measurement
  - Isolation valves
  - Drain valve
- Special process adapter for lance between tank and control unit

engineering for a better world

#### Installation example

Return to Jet mixer

Tank bottom to recirculation pump

#### Stress analysis of process adapter

- Insertion length 5,000 mm, extension tube DN 65, jet mixer type 6 – 80
- Static and dynamic loads (finite element analysis)
- Weld between lance pipe and cover plate considered critical
- Assumption of realistic operating conditions
  - Weld R = 2 mm (weld root depth = 1.4 mm)
  - − Vertical misalignment of lance pipe (e.g. installation error)  $\leq 5^{\circ}$
  - Pulsation caused by gas bubbles in fluid ( $\leq$  10 %)
- Conclusions:
  - System withstands all static loads
  - Fatigue strength assured

#### **Advantages**

- engineering for a better world
- Consistent total turnaround time of fermenters allows for optimized production scheduling
- Shorter fermentation, maturation and cooling times achievable; total occupation time of tanks have been reduced in many installations
- Increased fermenting capacity possible with the same number of tanks
- Maintain same high beer quality and flavor profile
- Higher degrees of final attenuation achievable
- Considerably lower operating costs compared to other concepts due to less energy consumption

# **Membrane Filtration**

#### GEA – Worldwide Leader in Membrane Filtration

GEA is a world-leader in membrane filtration technology for the beverage, brewery, food, vegetable/fruit juice and dairy industries.

- 1,000+ systems sold over 30+ years
- Process and process waste streams
  - GEA's membrane filtration technology began in the dairy industry but has grown dramatically as membrane technologies and new applications were developed.
  - Brewery now has most activity in North America!

## Neutral Base (NB)

engineering for a better world

- Neutral Base (NB) is an alcohol water mix derived from beer / fermented sugar solution
- NB is used to produce Flavored Alcoholic Beverages (FAB) by adding flavors, sweeteners, color etc.
- In many countries NB is a favored raw material for making FABs compared to grain alcohol due to its very low taxation level.
- Fermented products can have a strong influence on a beverage's flavor and can make FAB formulation a challenge.
- The key is to produce a base beer within the legal definition, but with virtually no flavor, aroma and color.
- GEA Membrane Filtration offers a simple economic process to produce NB.

#### Membrane definition:

• A membrane is a barrier to mass movement that allows restricted or regulated passage of one or more elements through it.

#### Goals in NB / Seltzer for brewers

- Produce a high alcohol, no color, low to no flavor base
- Produce a base efficiently and consistently
- Maintain brewery level hygiene
- Control operating and maintenance costs
- Make operation seamless and reliable
- Integrate process into existing brewery operation
- Find the right, product specific, solution for each customer

- Membrane filtration types can differ based on requirements.
- The appropriate level of separation is chosen based on a balance of factors such as feed quality, desired cleanliness of base, and overall production capacity needs.

engineering for

a better world

#### **Membrane Separations**

#### **Categories of Separations**

- Removal of Bacteria & Spores with MF
- Fermentation Broth Clarification with MF
- Fractionation of Proteins with MF
- Concentration of Suspended Material with MF and UF
- Clarification of Liquids with UF
- Purification and Concentration of Proteins with UF
- Removal / Concentration of Color Components with UF and NF
- NF

RC

- Separation of Components with NF (ex. Salts and Sugars)
- Purification of Low MW organics (alcohols, etc.) with NF and RO
- Concentration of Low MW Components with NF and RO

### NB and seltzer

### **Overview of Membrane Technology**

#### **Short List of Membrane Materials**

• Inorganic

- Ceramics	MF, UF
<ul> <li>Stainless Steel</li> </ul>	MF, UF
Polymeric	
<ul> <li>Polysulfone (PS)</li> </ul>	MF, UF
<ul> <li>Polyethersulfone (PES)</li> </ul>	MF, UF
<ul> <li>Polyvinylidene fluoride (PVDF)</li> </ul>	MF, UF
<ul> <li>PTFE Fluorocarbon</li> </ul>	MF
– PES / PVP Blend	MF, UF
<ul> <li>Cellulose Acetate Blend (CA)</li> </ul>	RO
<ul> <li>Sulfonated PES</li> </ul>	UF NF

- Thin Film Composite (TFC) UF, NF, RO
- More than 150 materials have been used to make membranes

#### **Spiral-Wound Membranes**

![](_page_24_Picture_1.jpeg)

#### Anatomy of a Spiral-Wound Membrane Element

![](_page_24_Figure_3.jpeg)

#### Principle Function of NF and/or RO

![](_page_30_Picture_0.jpeg)

# **Beer De-alcoholization**

#### **De-alcoholized Beer - Market Trends**

![](_page_31_Picture_1.jpeg)

- De-alcoholized beer market drivers
  - Health conscious consumers
    - Lower calorie
    - · Little/No alcohol
  - Non Alcoholic beverage alternative (i.e. soft drinks)
  - Pregnant woman and nursing mothers
  - People who abstain for other reasons
  - New technologies create opportunities for Better Beer!
- De-alcoholized beer market trend
  - Consistently outperforming total beer
    - Year after year growth
  - Europe has majority of market share
  - Compound Annual Growth Rate ~7.5%
  - Huge opportunity for North America Market

![](_page_31_Picture_16.jpeg)

#### Global sales growth of conventional vs. nonalcoholic beer

![](_page_35_Figure_2.jpeg)
# **Operation Step 2 "Diafiltration"**

### **Operation Step 3 "Blending"**

# De-alcoholization of beer - Batch plant operation

- 1. Fill Batch tank
- 2. Start Process
- 3. Pre-Concentration

6.

- 4. Diafiltration (washing out the alcohol)
- 5. Water Blending after batch end
  - Dealcoholized beer discharge to carbonization, pasteurization, filling

7. CIP cleaning of system (Tanks & Pipes with Brewery CIP)

- Special membrane cleaning program
- Sanitation: cold / chemical (<50°C)
- Membrane storage: ≥ 24 hrs down

#### Membrane Dealcoholization Batch operation (50-500 hls per 24hrs with CIP)

#### engineering for a better world

#### Conveniently sized for Craft Brewers!

# Alternate Technologies - Comparison

**Cross Flow Filtration** 

Distillation

Processing temperature	Cold (≤ 10°C) – Low/No thermal Impact	High (≥ $38^{\circ}$ C) – High thermal impact
Aroma losses	Reverse Osmosis - Very low (GEA "AromaPlus")	Very high - Without "aroma-recovery" Moderate - With "aroma-recovery"
Design	<u>Hygienic design</u> / CIP´able Units modular, built in expansion slots	CIP able (difficult cleaning with hazy beers) No expansion capability
Footprint	Small (height 4 meters)	Large (especially with respect to height)
Capex	Low	High
Opex	Similar	Similar
Explosion proofing requirements	No (alcohol % is max as high as in mother beer)	Yes (additional cost/administration)
Pre-treatment of beer	No (beer after maturation or filtration ok)	De-Carbonization, removal of yeast
Downstream processing	Blending, Carbonation, Pasteurization	Blending, Carbonation, Pasteurization

Cross Flow Filtration with "Aroma Plus" technology is GEA's preferred method for dealcoholizing flavorful and aromatic beers... ie Craft brewed beers!

# Piloting at GEA - Hudson, WI (example)

Product: Imperial Stout 9.5% ABV

- Permeate (picture right) immediately came out clear, and free of noticeable taste or odor
- EtOH removed in Preconcentration step
- Diafiltration brought EtOH level well below needed level.
- Blended back to original beer gravity with resulting alcohol of 0.25%
- Beer body and character in alcohol free beer remarkably comparable to the original!

# Membrane De-alcoholization Technology

#### Advantages of Membrane Filtration

- High quality beer with retained aroma profile
  - Capable of 0.5% or 0.05% ABV
- Filtered or Unfiltered beers
- Modular design / expandable
- Food grade membranes FDA approved
- Hygienic design
- · Compact, skidded-system with full automation
- Integrated cleaning (CIP)

engineering for

a better world

# Membrane De-alcoholization Technology

engineering for a better world

- Full flavor and aroma retention
  - Flavor, aroma, and color compounds stay in the beer
- Cold processing
  - Gentle on beer No thermal impact
- Innovations
  - Reduced ABV Beer styles
    - "Session double IPA anyone?"
  - Ingredient additions post alcohol removal
    - Make multiple products from one
    - Purees, extracts, hop resins, botanicals, etc.
- Flexibility
  - Brew the beer you want
    - Decide what ABV you want later

### **Testimonial**

# Mix Blend GEA DICON™

# DICON™ Mix Blend System - Overview

- Technology adapted for many Applications
  utilizing Continuous In-Line Blending
  - Soft Drinks
  - Fruit Juices
  - Beer and beer-mix beverages
  - Milk products
  - Alcoholic Drinks
  - Home and body
  - Chemical
  - Many more

engineering for a better world

#### Craft Beer and Beyond

### DICON™ Mix Blend System - Overview

- Continuous In-Line Blending
  - Liquids are mixed in the pipeline
  - Flow of all Components are simultaneous
  - The ratio of all components are controlled at all times
  - Product Leaving the system is homogenously mixed
  - Inline quality analysis to verify ratio control
    - Mass flow meters can be used to control system to ensure more efficient mixing results
  - Multiple Component Streams

### DICON<sup>™</sup> Mix Blend System - Advantages

- Direct processing of raw products, that means:
  - Prompt availability of the product
  - Small product stocks in the system
- **Big mixing tanks (and their CIP!) are not necessary**, that means:
  - Low space requirement, possible realization even in small rooms
  - Saving of investments for buildings (air con)
- Fast reaction to changes in the production plan
  - Just in time production possible
- Special automatic start-up and shut-down sequences to avoid product losses
- Saving of time and (mixing) energy
- Savings in labor cost (process and lab)
- Quality control in real time
- 25 years experience in in-line blending!

# DICON™ Mix Blend System - Advantages

#### Digitally Assured Reproducibility

- Digital controllers provide a constant and precise mixing ratio, even when process conditions vary
- Totally Compensated Control Deviators
  - Pulse-accurate dosing and digital signal processing ensure perfect mixing results
- Flexibility
  - Quick product changeovers
  - Tight tolerances
  - Varying flow ranges
  - Start/Stop functions

# DICON-C<sup>™</sup> Deaerator/Proving Lantern

Application:

- Avoiding of air in pump housing
- Avoiding of air in the metering equipment caused by hose change-over, empty pipe parts or vortex in tank
- Trapped air effects flow meters negatively uncontrollable, also mass flow meters!
- Automatic flow meter check
  - Volume in lantern (a constant volume) is being compared with flow quantity measurement
  - No production stop during this sequence
- Automatic container change-over
  - No production stop

# DICON-C<sup>™</sup> Deaerator/Proving Lantern

In-line blending unit for 8 components:

- Beverage water
- Liquid sugar
- 6 concentrates

# Flash Pasteurization ECO-FLASH™

#### Experience

GEA has been successfully involved in hygienic plant design for more than 50 years:

- +300 references for beer pasteurizers worldwide
- +250 references for milk/food pasteurizers worldwide
- Global brewing groups use GEA as auditor for all installed pasteurizers

- Insured Quality!

#### Why Pasteurize?

Flash pasteurization is crucial for stable product quality with original taste

- Thermal inactivation of microbiological properties in the product
  - Destruction of microorganisms without harming the product
- Sustained quality of the product is ensured
  - strict hygienic design criteria
  - all-time accurate temperature profile
  - Always keeping a positive pressure difference between pasteurized product and unpasteurized product
- Inactivation of foam-negative proteinases excreted by the yeast
- Increased shelf stability

# **ECO-FLASH** Layout

# **Product Quality Factors**

Precise temperature control ensures:

- Product safety
- Reliable pasteurization effect
- Consistent product quality

Minimized product losses & downtime

- Buffer tank level control integrated with filler speed
- During standby mode: water is recirculated instead of product
  - Maintains product quality and reduces product loss
- Use of on-board sterilization (circulation loop) for heating-up

The GEA solution ensures ideal interaction between the different control loops and can achieve PU accuracy of up to +/- 1!

# GEA VIPOLL Filling and Packaging

# How are you filling today?

Craft Beer and Beyond

# About VIPOLL and GEA

 VIPOLL is a Slovenian based company with expertise in packaging equipment/solutions world wide

- Est. 1991

- Specialized in equipment for filling beer, non-carbonated and carbonated beverages (hot and cold) in:
  - Cans, Glass, Aluminum bottles, PET
- 2018 VIPOLL joined GEA Group

# Capacity range

Filling lines speed - range of min. / max. capacities:

#### Glass line

- From 40 bpm up to 750 bpm
- Starting with 16 filling valves up to 130 filling valves
- Can line
  - From 50 cpm up to 1,000 cpm
  - Starting with 16 filling valves up to 120 filling valves
- PET line
  - From 50 cpm 500 bpm
  - Starting with 24 filling valves up to 120 filling valves
- ALL IN ONE
  - From 50 cpm 420 cpm
  - Starting with 16 filling valves up to 70 filling valves

Craft Beer and Beyond

# Turnkey Project Approach – Overview

- We pay attention to your needs, offer advice and create the best possible solution for the capacities and beverages of your choice.
- You can choose between machines from our production line or order a **complete turn-key filling line** (in partnership with other established companies).

# All In One Filling

Craft Beer and Beyond

Glass

Visitron Filler ALL IN ONE

- A flexible and space saving solution for cans, glass and **PET bottles**
- Speed range: from 50 cpm up to 420 cpm
- **Can / bottle range**: from 150 ml (5 Oz) up to 3,000 ml (100 Oz)
- Suitable for
  - still and carbonated drinks •
  - hot and cold filling .
  - beer / CSD / juice / syrup / wine / sparkling wine / • spirits
- Excellent choice for small and medium sized plants or pilot plants
- Revolutionary fast format change

#### Floor requirement: comparison

#### Glass line

#### ALL IN ONE line

## ALL-IN-ONE filler

By processing cans, glass and PET bottles, hot and cold filling, there is significant savings potential compared to conventional filling systems with only one type of container:

- Combined can / glass filling line take about 60% less floor space
  - → Lower investment in buildings, lighting, ventilation and energy
- A combined can / glass filling line require a reduced amount of equipment in the plant
  - → Less time and material for maintenance
  - → Reduced stock of spare parts
  - $\rightarrow$  Single line offers higher rate of utilization than multiple lines
- In a few words... Lower OPEX and CAPEX

#### **ALL-IN-ONE** filler

- Since the first presentation at the Drinktec in September 2017, GEA VIPOLL's "ALL-IN-ONE", has been greeted with great success. As one of the most flexible filling blocks in the market for cans, glass and PET bottles, GEA Vipoll lines have been delivered all around the globe. The most common application is the can - glass combination.
- March 2019: The ALL-IN-ONE receives two awards from the APPMA Awards of Excellence in Melbourne / AUS: "Best New Product" and the "Imported Equipment Award".
- Going forward bottlers are expected to focus on beverage innovations and more flexible production, making better use of marketing potential through the use of different types of containers.
